

## POTENTIAL FISH HATCHERY SITE

Reported by: Robert T. Baade

Date: 4/21/69

### COMMENTS

1. Site (name) location.  
Bakewell Creek on Bakewell Arm of Smeaton Bay, S. Behm Canal.  

---
2. Usable land area -  
40 plus acres desirable.  
  
There is room for a hatchery at the mouth of this creek although there is more grade than absolutely necessary.  

---
3. Adequate and dependable  
water supply. 5-10 c.f.s.  
  
Bakewell Lake would be the adequate and dependable water supply with the option of temperature selection during the summer. The pipeline would be approximately 1.2 miles long.  

---
4. Accessibility: Road or  
ferry route. On salt water  
(except Interior Alaska) or  
at a low elevation.  
  
This site is 48 miles from Ketchikan by boat. Deep water exists at the site and barge supply is easy.  

---
5. Natural rearing - lakes and  
streams - should be available  
close to population centers  
and fishing pressures to cut  
costs. Fresh water planting  
areas should lend themselves  
to evaluation of program  
productivity.  
  
Bakewell Lake and Badger Lake are the only near natural rearing areas. Both are populated by cutthroat trout.

COMMENTS

6. Fish brood stocks  
available to site.

Brood stocks available at the site are silver, sockeye, chum, pink and possibly king salmon, cutthroat, dolly varden and steel-head trout.

- 
7. General comments.

This site was listed because of the water supply aspect and the opportunity to monitor the fish way installed several years ago over the falls in the creek.
